uPricing - Documentation

Preface

Hello and thank you for your purchase. In this document we will walk you through setup and use of the uPricing for Wordpress. We will explain the theory and thinking behind the plugin in order to help you understand its starting position and use this knowledge towards improving your experience with it.

Support

This document is designed to give you as much support as possible, but cases might appear where you need additional assistance. The best way to get support is to look at item discussion at CodeCanyon. Chances are that other people already had similar problems and we may have helped them already. If you can not find anything there, feel free to ask either right there using the comment system, or you can send us a message via our [profile page](#) at CodeCanyon.

Please do not use our regular mail or contact form at our page, because we need to verify your purchase and we are not able to do that using these options.

Alternatively you can follow us on [Twitter](#), [Facebook](#).

Features

- Advanced Drag&Drop admin interface
- Multiple color options
- Compatible with All major browsers
- Product-oriented workflow
- Easy to use
- Easy to integrate with our existing products and other plugins

Usage Overview

In order to display a pricing table in your site you need to follow these rough steps:

1. Install plugin
2. Create and fill your pricing table
3. Embed it into your page and/or posts

We will go over these steps in this documentation.

Installation

Installation should be fairly straightforward. In a couple of steps you should have the plugin installed.

Note: uPricing requires at least WP version 2.8. It might work with even older versions but we can not guarantee it.

1. Log in to your Wordpress admin and go to Plugins > Add New
2. Click Upload to bring up the Plugin Upload Dialog
3. Select the plugin and upload it
 - Alternatively, if for some reason this does not work, you can unpack the plugin on your computer and then just upload it to /wp-content/plugins via FTP
4. Go to Plugins > Plugins and you should see uPricing among your inactive plugins
5. Click Activate in the uPricing row
6. You're done!

Post-install setup and use

1. Create new Pricing Table
2. Fill in a name
3. Pick a style
4. Create properties
5. Click Add/Edit Products link in the top right corner
6. Fill in your products

After installation you can proceed to create your first Pricing Table. All pricing tables consist of two dimensions: Structure (Vertical) and Products (Horizontal). In order to be able to add products to your pricing table you need to first create the structure.

Properties are the actual properties of your products. Let's say you are selling cars, then the properties could be: Color, Airbag, Engine (kW/hp), etc. You can choose the type to be either text or checkbox. For each of these properties there will be generated a field in the Products form, where you will be able to set the actual value of the property.

Next you can add your products (i.e. the individual cars). For each car you'll be able to add a Name, Price, Unit, Call to action Link and Label, Featured and then you'll be able to set all properties.

Name: will appear at the top of each column

Price: e.g. \$20, the currency is not added automatically so you can add any currency

Unit: e.g. Per Piece, Per Kilogram, Single License

Call to action Link: you can add the link to a detail page for that product here

Call to action Label: label for the detail link, e.g. Buy!

Featured: one of your products can be featured

Embed

In order to include your Pricing Table into a page or a post, just open the main pricing tables listing and copy the shortcode from the shortcode field. This shortcode is in this format:

```
[uds-pricing-table name="Your table name"]
```

Alternatively, if this does not work for you, you can try using a lowercase name without spaces and then call it like this:

```
[uds-pricing-table name=name]
```

It is possible to have multiple pricing tables, even on the same page.
